A Jain PharmaBiotech Report
AUTHOR'S BIOGRAPHY

Professor K. K. Jain is a neurologist/neurosurgeon with specialist qualifications including Fellowships of the Royal Colleges of Surgeons in Australia and Canada. He has trained, practiced and held academic positions in several countries including Switzerland, India, Iran, Germany Canada and USA. After retirement from neurosurgery, Prof. Jain remains a consultant in neurology. He is also working in the biotechnology/biopharmaceuticals industry and is a Fellow of the Faculty of Pharmaceutical Medicine of the Royal College of Physicians of UK. Currently, he is the CEO of Jain PharmaBiotech.

# Table of Contents

0. Executive Summary ................................................................. 14

1. Introduction to Animal Biotechnology ........................................ 16
   Introduction ........................................................................... 16
   Historical evolution of animal biotechnology .......................... 16
   Basics of biotechnology ....................................................... 17
   DNA .................................................................................... 17
   RNA .................................................................................... 17
   Genes .................................................................................. 18
   Single nucleotide polymorphisms ........................................... 18
   Copy number variations in the genome .................................... 18
   DNA sequences ..................................................................... 19
   Gene expression ..................................................................... 19
   Gene regulation ...................................................................... 20
   Proteins ............................................................................... 20
   Functions of proteins ............................................................ 21
   Recombinant proteins ........................................................... 21

Animal genetics ............................................................................ 22
   Molecular genetics ............................................................... 22
   Twinning in cattle ............................................................... 22
   Pig genetics .......................................................................... 22
   Genetic studies in dogs ....................................................... 23

Animal genomics ........................................................................... 23
   Avian genomes ...................................................................... 23
   Chicken genome ..................................................................... 23
   Turkey genome ................................................................. 24
   The mouse genome ............................................................ 25
   The cat genome ..................................................................... 25
   The dog genome ............................................................... 26
   Sequencing of the dog genome ............................................. 27
   Comparison of genomes of healthy and diseased dogs .......... 28
   Analysis of DNA copy number variation ............................... 29

Marsupial genomes ....................................................................... 29
   Genome of the Tibetan antelope ......................................... 30
   Livestock genomics .............................................................. 30
   Bovine genome .................................................................... 31
   Bovine SNP map .................................................................. 32
   1,000 Bull Genomes Project ................................................. 33
   Bovine stomach microbiome genes ....................................... 33
   Camel genome ...................................................................... 34
   Goat genome ....................................................................... 34
   Horse genome ...................................................................... 35
   Pig genome .......................................................................... 36
   Sheep genome ...................................................................... 37

Fish genomes ................................................................................ 37
   The Salmon genome ............................................................ 37
   Genome of the Northern snakehead ..................................... 37
   Whale genome ...................................................................... 39
   Genomes of non-human primates ........................................ 39
   Chimpanzee genome ............................................................ 40
   Genome of the rhesus macaque ........................................... 40
   Genome of gorilla .............................................................. 41
   Priority genome list of the National Human Genome Research Institute ............................................. 41

Animal proteomics ....................................................................... 42
   Applications of proteomics in animals ................................. 42
   Caseins in goat milk ............................................................ 43
   Lactic acid bacteria ............................................................. 43
   Applications of proteomics in animal healthcare .................. 43

Bioinformatics ............................................................................... 43
   Biomarkers and animal health ............................................. 45
   Personalized medicine for pet animals ................................. 47
   Monoclonal antibodies and animal health ............................ 47
   Antigenomics ........................................................................ 47

Nanobiotechnology and animal health ....................................... 48
   Stem cells and animal biotechnology .................................... 48
   Rescuing extinct animals with stem cells ............................ 48
   Animal biotechnology in relation to other technologies ......... 49
2. Application of Biotechnology in Animals ............................................. 52

Introduction .......................................................................................... 52

Applications of animal genomics .............................................................. 52

- Bovine ankyrin 1 gene and beef tenderness ........................................ 52
- Chicken breeding based on genomics .................................................. 53
- Genomics of disease resistance .............................................................. 53
- Genomic selection to exploit gene-environment interactions .................. 53
- Genome wide associations and milk production in cows ......................... 54
- Low cost genotyping for genetic improvement in dairy cattle .................. 54
- SNPs and longevity in dairy cattle ......................................................... 54
- Share genomic data to improve cattle breeding .................................... 55
- Statistical genomics to improve breeding .............................................. 55

Genetic engineering and gene editing ....................................................... 55

- CRISPR/Cas9 gene editing in animals ............................................... 55
- Disease control by genetic engineering ................................................. 56
- Improvement of livestock by genetic engineering ................................ 56
- Limitations and precautions for genetic engineering .............................. 56

Transgenic animal technology .................................................................. 56

- Cloning animals .................................................................................... 58
  - Nuclear transfer technology ................................................................. 58
  - Nuclear bisection for cloning ................................................................. 59
  - Zona-free cloning method .................................................................... 60
  - Abnormalities in cloned animals .......................................................... 60
  - Cloning from embryonic cells ............................................................... 62
  - Cloning of rabbits ................................................................................. 62
  - Cloning the rat ...................................................................................... 62
  - Cloning the horse .................................................................................. 63
  - Cloning the cow ................................................................................... 63
  - Cloning the dog .................................................................................... 63
  - Cloning in primates .............................................................................. 64
  - Episomal vector-mediated gene delivery ............................................ 64
  - Lentiviral transduction of male germ-line stem cells ........................... 64
  - Lentiviral transgenesis ......................................................................... 65
  - Retrovirus-mediated production of transgenic animals ......................... 65
  - Sperm-mediated gene transgenesis ......................................................... 65

Animal models of human diseases .......................................................... 66

- Gene editing in large animals ............................................................... 66
- Cloning of gene-edited dogs as models of human genetic diseases .......... 68

Production of recombinant proteins ......................................................... 68

Transgenic pharmaceuticals ....................................................................... 68

- Proteins from the milk of transgenic animals ......................................... 69
  - Advantages of milk as source of transgenic proteins ............................ 70
  - Therapeutic proteins from rabbit milk .................................................. 71
  - Recombinant human antibodies from goats ......................................... 71
  - Therapeutic proteins from goat milk ..................................................... 72
- Chicken transgenesis for production of biopharmaceuticals ................. 72
- Concluding remarks about production of transgenic proteins in animals 73
- Companies involved in production of transgenic pharmaceuticals ......... 73

Transgenic food products ......................................................................... 74

- Milking genetically modified cows ......................................................... 74
- Genetically modified fish ...................................................................... 74
  - Genetically engineered salmon ............................................................. 74
  - Gene transfer approaches to enhance growth of other fish species ....... 75
- Cloned animals as sources of milk and meat .......................................... 75

Animal feeds from transgenic plants ......................................................... 76

Transgenic modification of plants to increase nutritional value of animal feeds 76

Transgenic disease models ....................................................................... 76

- Technologies to create transgenic disease models .................................. 76
  - Gene manipulation techniques .............................................................. 77
  - Embryonic stem cells for gene targeting .............................................. 77
  - Homologous recombination ................................................................. 77
  - Transgenic animal models of human diseases ....................................... 78
  - Transgenic models for studying human drug metabolism and toxicity .. 79
- The Human Genome Project and the role of transgenics ....................... 79
- Genomic and proteomic analyses of transgenic animal models ............. 80
- Concern about health and welfare of transgenic animals ....................... 80
- Safety of transgenic technology ............................................................ 81
- Concluding remarks about use of transgenic animals ......................... 81

RNA interference technology .................................................................... 81

- RNAi versus antisense ......................................................................... 81
- Applications of RNAi in animal biotechnology ..................................... 82

4. Molecular Diagnostics in Animals ........................................ 124

Introduction ........................................................................ 124

Nucleic acid technologies .................................................. 124
The polymerase chain reaction .............................................. 124
Basic Principles of PCR ...................................................... 124
Target selection .................................................................. 125
Detection of amplified DNA ............................................... 125
Real-time PCR systems ...................................................... 125
LightCycler PCR system ...................................................... 126
Molecular beacons ............................................................ 126
Applications of PCR in veterinary medicine ...................... 126
Fluorescent in situ hybridization ....................................... 127

Immunodiagnostics ............................................................. 129
Enzyme-linked immunoassays ............................................ 129
Bovine Gamma Interferon Test ........................................... 129
Antigen diagnosis of trichinosis ......................................... 130
Parachek™ for the diagnosis of Johne's disease ................. 130
Antibodies for differentiation between vaccinated and infected animals .......................................................... 131

Biochip/microarray technology ............................................ 131
Applications of microarrays in animal biotechnology .......... 132
eSensor™ electrochemical biochip ...................................... 132
FR 48 microfluidic biochip ............................................... 132
SNPchip® v.3 for standardizing livestock SNP data............... 133

Biosensors ........................................................................... 133
Imunosensors ..................................................................... 134
Biosensor for ovulation prediction in dairy cows ................ 134

Flow cytometry for animal diagnostics ................................ 135
Molecular imaging in animals ............................................ 135
Veterinary cytogenetics ...................................................... 136
Applications of sequencing for veterinary diagnostics ...... 137
Role of sequencing in detection of cancer biomarkers .......... 137
DNA sequencing for study of bacterial epidemics .............. 137
Role of sequencing in epidemic of Shiga toxin-producing E. coli .......................................................... 138
Role of sequencing in the study of genetic disorders in animals .......................................................... 138

Applications of molecular diagnostics in animals ............ 139
Canine DNA testing ......................................................... 139
Use and abuse of genetic testing of dogs ......................... 140
Cat pedigree determined by gene tests .............................. 141
Diagnostic aids to selective breeding ............................... 141
Selection of desirable traits .............................................. 141
Gene variations and fat content of beef ......................... 142
Using genetic markers for improved milk production in dairy cattle .......................................................... 142
Application of bovine genomics for improving milk yield .......................................................... 143
Recognition of hereditary syndromes .............................. 143
Genetic markers in animals .............................................. 144
SNP genotyping in animals .............................................. 144
SNP genotyping for selective breeding of chicken ............. 144
Animal identity and parentage analysis .............................. 144
Animal species identification in food .............................. 145
Diagnosis of infections .................................................... 145
Bacterial infections ......................................................... 145
Diagnosis of fungal infections in animals ....................... 146
5. Biotechnology-based Veterinary Medicine ........................................... 168
   Introduction .................................................................................. 168
   Biotechnology versus pharmaceutical products ............................... 168
   Role of biotechnology in drug discovery and development ............... 169
   Biological therapies in veterinary medicine ...................................... 169
   Cost of veterinary vs. human drug discovery and development .......... 169
   Advantages and disadvantages of testing biotech products in animal models 170
   Biotechnology-based antiparasitic drugs ........................................... 170
   Non-antibiotic strategies for control of infections in animals ............... 170
      Probiotics .................................................................................. 170
         Potential role for probiotics in the human gut .............................. 171
         Potential role for probiotics in animals ....................................... 171
      Probiotic bacteria for control of pathogens in cattle ....................... 172
      Nonantibiotic drugs for infections in animals .................................. 173
         Immunomodulation as an alternative to antibiotics in infections .... 173
         Cathelicidins: effector molecules of mammalian innate immunity ... 173
         Bacteriophage therapy for antibiotic resistance ............................ 174
   Biotechnology for treating tendon injuries ....................................... 174
      Use of growth factors to facilitate tendon injuries .......................... 174
   Productivity enhancers ..................................................................... 175
      Bovine somatotropin for increasing milk production in dairy cows .... 175
      Increasing milk production in cows by feeding propionibacteria ....... 176
      Use of growth factors .................................................................... 176
   Transgenic plant products for use in animals ..................................... 177
   Biotechnology-based vaccines ......................................................... 177

Diagnosis of viral infections ................................................................. 146
   Molecular diagnosis of avian influenza .............................................. 148
   Molecular diagnosis of swine influenza .......................................... 149
   Diagnosis of parasitic infections ....................................................... 149
   Detection of natural or bioterror threats to livestock ......................... 150
   Detection of Trichomonas foetus DNA in cattle ................................. 151
   Molecular diagnosis of prion diseases .............................................. 151
   Bovine spongiform encephalopathy .................................................. 151
   Testing for BSE in living animals ....................................................... 153
   Prions in urine .................................................................................. 153
   Diagnosis of chronic wasting disease in wildlife ............................... 153
   Developing new tests for prion diseases .......................................... 154
   Differentiation among various types of TSEs ..................................... 154
   Protein cyclic amplification .............................................................. 154
   Antibody tests for prion diseases ..................................................... 155
   Scrapie genotyping .......................................................................... 155
   A real-time ultrasonic method for prion protein detection .................. 156
   Companies involved in developing molecular diagnostics for TSEs ...... 156
   Diagnosis of genetic disorders ......................................................... 157
   Genes associated with exercise-induced collapse ............................. 157
   Preimplantation genetic diagnosis .................................................... 157
   Diagnosis of cancer in animals ........................................................ 158
   Diagnosis of skin cancer ..................................................................... 158
   Diagnosis of canine mammary carcinoma ........................................ 158
   Diagnosis of food-borne pathogens .................................................... 159
      Introduction .................................................................................. 159
      Molecular diagnostic methods used in food-borne infections ............ 159
      Detection of Listeria-contaminated foods ........................................ 160
         Optical biosensor for detection of Listeria ................................. 160
         Real-time PCR for detection of Listeria ...................................... 160
      Detection of Salmonella .................................................................. 161
      MicroSEQ® Salmonella Detection Kit ........................................... 161
      Detection of toxoplasmosis ............................................................. 161
         E. Coli detection .......................................................................... 161
      DuPont Bax system ......................................................................... 161
         MLG method for detection of multiple STEC strains ............... 162
      RapidFinder™ STEC ...................................................................... 162
      A genomic approach to study of animal food-borne illness in humans 163
      Limitations of use of molecular probes in food analysis ................... 163
      Companies with technologies for food pathogen detection .......... 163
      Biotechnology-based novel diagnostics for aquatic animals .......... 164
   Detection of chemicals in foods of animal origin ............................. 165
      Companies developing molecular diagnostics for animals .......... 165
   Prions in urine .................................................................................. 153
   Diagnosis of chronic wasting disease in wildlife ............................... 153
   Developing new tests for prion diseases .......................................... 154
   Differentiation among various types of TSEs ..................................... 154
   Protein cyclic amplification .............................................................. 154
   Antibody tests for prion diseases ..................................................... 155
   Scrapie genotyping .......................................................................... 155
   A real-time ultrasonic method for prion protein detection .................. 156
   Companies involved in developing molecular diagnostics for TSEs ...... 156
   Diagnosis of genetic disorders ......................................................... 157
   Genes associated with exercise-induced collapse ............................. 157
   Preimplantation genetic diagnosis .................................................... 157
   Diagnosis of cancer in animals ........................................................ 158
   Diagnosis of skin cancer ..................................................................... 158
   Diagnosis of canine mammary carcinoma ........................................ 158
   Diagnosis of food-borne pathogens .................................................... 159
      Introduction .................................................................................. 159
      Molecular diagnostic methods used in food-borne infections ............ 159
      Detection of Listeria-contaminated foods ........................................ 160
         Optical biosensor for detection of Listeria ................................. 160
         Real-time PCR for detection of Listeria ...................................... 160
      Detection of Salmonella .................................................................. 161
      MicroSEQ® Salmonella Detection Kit ........................................... 161
      Detection of toxoplasmosis ............................................................. 161
         E. Coli detection .......................................................................... 161
      DuPont Bax system ......................................................................... 161

6. Research in Animal Biotechnology ........................................ 208
7. Animal Biotechnology Markets ................................................................. 224

Introduction ............................................................................................... 224

Markets for biotechnology-based products for animal healthcare ................ 225

Markets for recombinant proteins for animal healthcare .................................. 226
Markets for vaccines for animals .................................................................. 226

Markets for animal diagnostics .................................................................... 227
Test for bovine spongiform encephalopathy .................................................. 227
Markets for transgenic laboratory animals .................................................... 228

Animal biotechnology markets according to therapeutic areas ...................... 228

Markets for biotechnology-based animal products for humans ...................... 229
Transgenic proteins ..................................................................................... 229
Market for xenotransplantation ..................................................................... 229

Strategies for promoting use of animal biotechnology .................................... 230
Financial losses from death and disease in animals ....................................... 230
Losses in farm animals ................................................................................ 230
Losses in poultry ....................................................................................... 230
Losses in equine industry ........................................................................... 230
The emerging role of pet owners .................................................................. 231

Improvement in cattle through application of biotechnology ......................... 231
Economic aspects of genomic evaluation of dairy cattle ................................ 231
Pig market .................................................................................................. 231
Cattle Market ............................................................................................ 232
Poultry market ........................................................................................... 232
Milk from genetically modified cows ............................................................ 232

Impact of biotechnology on fish markets ...................................................... 233
Role of biotechnology in livestock performance enhancer market ............... 233
Gene transfer technologies .......................................................................... 233
In vitro meat production and animal biotechnology markets ....................... 233
Cost-benefit aspects of transgenic proteins .................................................. 234
Lower costs of transgenic production ........................................................... 234
Lower costs of treatment ............................................................................ 234

Unmet needs in animal biotechnology ......................................................... 234

Future of animal biotechnology .................................................................... 235
Farm animals .............................................................................................. 236
Global trends in epidemiology of livestock diseases ...................................... 236
Genetic engineering of animals ................................................................... 236
Companion animals .................................................................................... 236
Animal molecular diagnostic markets ........................................... 237
Future marketing status of animal-derived biotechnology products .... 237

8. Regulatory issues ........................................................................ 238
   Introduction ................................................................................... 238
   Regulatory agencies for veterinary biotechnology in the US .......... 238
   FDA regulatory issues in agricultural biotechnology ................. 239
   FDA guidelines on use of antibiotics in food-producing animals ... 240
   FDA and veterinary stem cell therapy ........................................... 241
   Food safety evaluation of transgenic animals ............................... 242
   Food from cloned animals ............................................................. 243
   FDA investigation of drug transfer into eggs ............................... 244
   Animal feed safety ....................................................................... 245
   Medicated feeds .......................................................................... 246
   Regulatory issues of transgenic proteins ...................................... 246
   Risks of animal biotechnology ..................................................... 246
   FDA regulation of bovine products .............................................. 247
   Worldwide biotechnology regulatory and trade issues .......... 247

9. Companies Involved in Animal Biotechnology ............................ 250
   Introduction ................................................................................... 250
   Biotechnology at top veterinary pharmaceutical companies ....... 250
   Profiles of selected companies .................................................... 250
   Collaborations ............................................................................. 347
